

To search any log events or AI data (such as LPR or Face comparisons) from the **server side**, you must have a **HDD installed in Disk 1** and format it for “**BUSINESS DATA USE.**”

Without this HDD installed and properly formatted, **no logs can be retrieved** in the event of an unexpected issue, and **no AI events can be searched locally from the SERVER**

For any other data you wish to save — such as live snapshots, playback recordings, or exported video — **a HDD must be installed in slots 2–8** and formatted for “**STORAGE USE.**”
